**(54) GEL COMPOSITION COMPRISING
DISPERSED INSOLUBLE SOLID MATERIAL
AND APPLICATION THEREOF**

(57) Abstract:

PROBLEM TO BE SOLVED: To produce a uniform gel composition capable of uniformly dispersing an insoluble solid material even when a filling operation is carried out at a relatively high temperature (at about 65°C)

during production, usable for a good dessert or the like without a pasty texture and maintaining a constant gel strength even when the filling operation is carried out under wide temperature conditions (at 45-65°C) from starting to finishing of the filling operation.

SOLUTION: This gel composition is obtained by adding a low-methoxy pectin to the gel composition containing the insoluble solid material.
